Is it possible for a President of the US, who is a liberal Democrat, to oppose agricultural subsidies for American farmers? Apparently, the answer is "yes" since Barack Obama believes that the carbon emissions from tractors pollute the environment and livestock animals emit odiferous smells that could lead to Global Warming.

Accordingly, Obama established a Harvard Study Committee to explain the necessity of ending agricultural subsidies for farmers and label this strategy as the "US competitiveness" plan for the Obama Energy Doctrine.

The Obama-Harvard Study Committee co-Czars are Daniel C. Esty and Steve Charnovitz as they published the President's new energy policies if Obama is re-elected to the White House. They outline "10 specific policy proposals that link sustainability and competitiveness."

The Obama-Harvard team lists as No. 7 this proposal, "sunset all agricultural subsidies and other government payments that result in unsustainable production practices and create protectionist trade barriers."

The White House intends to shift all funds from agricultural subsidies and funnel the benefits to defunct alternative energy companies such as Solyndra. This plan is clarified in No. 6 on the list, "increase federal funding of basic lean-energy research."
